

What is Air Naturalization?

The AirRestore Air Naturalizer creates a natural, charged flow that fills the room or vehicle and continually cleans the air.

The sun provides the outdoor air with the power and energy it needs to clean itself — a power and energy that indoor air lacks.

AirRestore provides indoor air with the charge it needs to virtually eliminate odors, allergens, dust and bacteria.

Outside your windows and doors, the sun and wind are constantly giving air a natural charge, helping it break down odors and allergens. Indoor air is typically cut off from that cycle, so it often becomes stale and full of unwanted odors, allergens and other unwanted particles. However, when you plug in an **AirRestore Air Naturalizer**, it re-energizes indoor air with that same power Mother Nature uses so it can break down those compounds and help get rid of them.

How does this happen?

The AirRestore Air Naturalizer makes energized versions of the natural elements already found in the air. It puts them to work, causing a series of reactions, just like the ones that happen naturally outdoors. These energized elements are given the power to clean up the air and help get rid of odors, allergens, mold and bacteria.

After the initial clean-up, the **Air Naturalizer** maintains the energized elements throughout the 800-square-foot space. This means the air is ready to deal with new challenges immediately. That helps maintain a clean, fresh environment in your living space.

The natural, charged flow continuously fills the room, giving the air the energy it needs to clean itself, just as the sun does for outdoor air.

Keeping the flow continuous is how an air naturalizer as small as the AirRestore can be so effective. And costs less than a penny a day to operate!
